

## **BoundField in GridView**

- ✓ The BoundField class is used by data-bound controls (such as GridView and DetailsView) to display the value of a field as text.
- ✓ For example, the GridView control displays a BoundField object as a column, while the DetailsView control displays it as a row.
- ✓ AutoGenerateColumns property allow us to automatically generate columns for gridview control. asp.net developers can manually specify which column fields appear in gridview by setting AutoGenerateColumns property value to False. if developers want to manually control the gridview columns then they need to define their own column field
- ✓ BoundField is the default column type of the gridview server control. BoundField display the value of a field as text in gridview. gridview control display a BoundField object as a column. developers can specify the field to display in a BoundField object by setting its DataField property.
